

Skate Assassin Runner - Project Summary

Generated: May 9, 2026

Workspace: C:\Git\SkateAssassinRunner_UnityMCP

Unity MCP / Editor

- Unity MCP is connected to one live editor instance:
SkateAssassinRunner_UnityMCP@164bd6139f58240e.
- Unity version: 6000.0.67f1. Project platform reported by Unity MCP: Android. Editor is idle and not in play mode.
- Active scene signals differed slightly between calls: manage_scene reported SkateRunnerLoadingScreen, while editor state reported SkateRunnerStartScreen shortly after. Both are project scenes and likely reflect a recent editor scene switch or stale status snapshot.
- Console query returned 0 log entries at the time of inspection.

Project Identity

- Product name in PlayerSettings: SkateAssassinRunner.
- The project is a mobile-oriented Unity runner/action game built around skating, enemy encounters, cash/gem rewards, missions, and a second-phase cinematic challenge/fail state.
- The repository contains Unity project folders, generated C# project files, an Android APK, keystore, mapping file, Packages, ProjectSettings, Assets, Library, Logs, Temp, and UserSettings.

Build Scenes

- Enabled build scenes are Assets/Scenes/SkateRunnerStartScreen.unity, Assets/Scenes/SkateRunnerLoadingScreen.unity, and Assets/Scenes/SkateRunner.unity.
- Disabled imported/demo scenes from More Mountains Infinite Runner Engine remain in build settings, including StartScreen, LevelSelection, Minimal demos, LaneRunner, JellyForest, BackwardsDragon, FlappyCloud, SkyTheory, Vertical, and Downhill scenes.
- Assets/Scenes also contains ArcMeterDemo, CharacterCreation, LinearMeter, TestAssets, and shared lighting settings.

Current Start Screen Scene Snapshot

- Root objects observed: Main Camera, SoundManager, StartScreenCanvas, and EventSystem.
- StartScreenCanvas uses Canvas, CanvasScaler, GraphicRaycaster, and HomeUIBinder.
- EventSystem includes TouchInputModule and InputSystemUIInputModule, indicating touch/mobile input plus Unity Input System UI support.

Gameplay Architecture

- The project extends More Mountains Infinite Runner Engine rather than building runner fundamentals from scratch.
- SkateRunnerGameManager extends GameManager and adds cash, gems, persistent profile totals, level number, ES3 save/load, haptic feedback on cash gain, and GUI refresh hooks.
- SkateAssassinRunnerLevelManager appears to coordinate the main level flow, while custom

enemy, camera, mission, UI, and VFX scripts add the game-specific layer.

- PlayerPhase2Controller manages Phase 2 failure execution: it can mark a pending execution, react to a bullet hit, play a Phase2Dead animation trigger, then kill the character through LevelManager.
- Input includes tap-only main action, swipe-right attack detection, swipe-down detection, ruthless tap mode/overlay, and accuracy/power meter UI scripts.

Missions and Progression

- MissionSystem assigns up to two distinct missions per level from configured MissionDefinition entries, supports level-banded targets, and emits UI events for assignment, progress, and completion.
- Mission types include kill enemies, kill via dash attack, kill via down attack, earn cash, earn Phase 2 cash, survive seconds, reach Phase 2 combo, use power slam, and finish Phase 2 with no fail.
- Star rewards are level completion plus completed missions, clamped to 0-3 stars.
- HomeUIBinder reads ES3 totals for cash, gems, and level number, then updates home/start screen labels.

Content and Assets

- Assets includes about 79 custom/script files under Assets/Scripts and about 110 prefabs under Assets/Prefabs.
- Key prefab groups: player/enemy characters, drones, EnemyType3 projectiles, LevelManager, ObstacleSpawner, micro-scenarios, roads, vehicles, cash, UI widgets, weapon prefabs, weapon VFX, down-attack VFX, and particle effects.
- The custom tags include Enemy, CarAccelerationCollider, StartDriftMarker, CarSlotMarker, and IgnoreDownAttack.
- Custom layers include Damageable, Obstacle, Player, Ground, LevelBounds, NoCollisions, Wall, PlayerInvincible, Phase2Car, and CinematicFx.

Technology Stack

- Unity packages include URP 17.0.4, Shader Graph 17.0.4, VFX Graph 17.0.4, Cinemachine 3.1.5, Input System 1.18.0, AI Navigation, Timeline, UGUI, TextMesh Pro via project assets, and Unity MCP from CoplayDev.
- Third-party/project assets visible in the repo include More Mountains Infinite Runner Engine/MMTools, Nice Vibrations, Damage Numbers Pro, DOTween/DOTween Pro, Easy Save 3 usage, Synty/Polygon assets, Cartoon FX, mesh slicing/combining tools, Polyverse Skies, and multiple stylized character/VFX packs.

Likely Game Loop

1. Player starts from SkateRunnerStartScreen, where saved cash/gems/level are displayed.
2. Loading transitions into SkateRunner.unity.
3. The runner moves through road/urban obstacle prefabs and micro-scenario chunks.
4. Player uses tap/swipe actions to jump, dash, down-attack, and fight enemies while collecting cash.

5. Missions track performance and award stars on successful completion.
6. Phase 2 introduces a more cinematic timing/execution sequence with power meter and fail/death behavior.
7. Level end saves cash/gems/level progress through ES3 and returns progress to the home UI.

Observations / Next Useful Checks

- Verify the active scene discrepancy by refreshing editor state before any scene editing.
- Review SkateAssassinRunnerLevelManager, PowerMeter, enemy controllers, and micro-scenario prefabs for exact runtime flow.
- Consider pruning disabled demo scenes from build settings before release if they are not intentionally kept.
- The Android APK and mapping file in the project root suggest a previous Android build exists; confirm whether these binaries should be versioned.
- No Unity console errors were present during this inspection.
